DELPHI WEB STUDIO PRO

Editor Reference

A clear guide to the controls you use most often

Keep this reference nearby when you know what you want to do but need to find the right command. It follows the editor’s visible controls and explains what to expect after you use them; the User Guide provides the longer examples.

Windows desktop edition
Last changed November 10, 2026

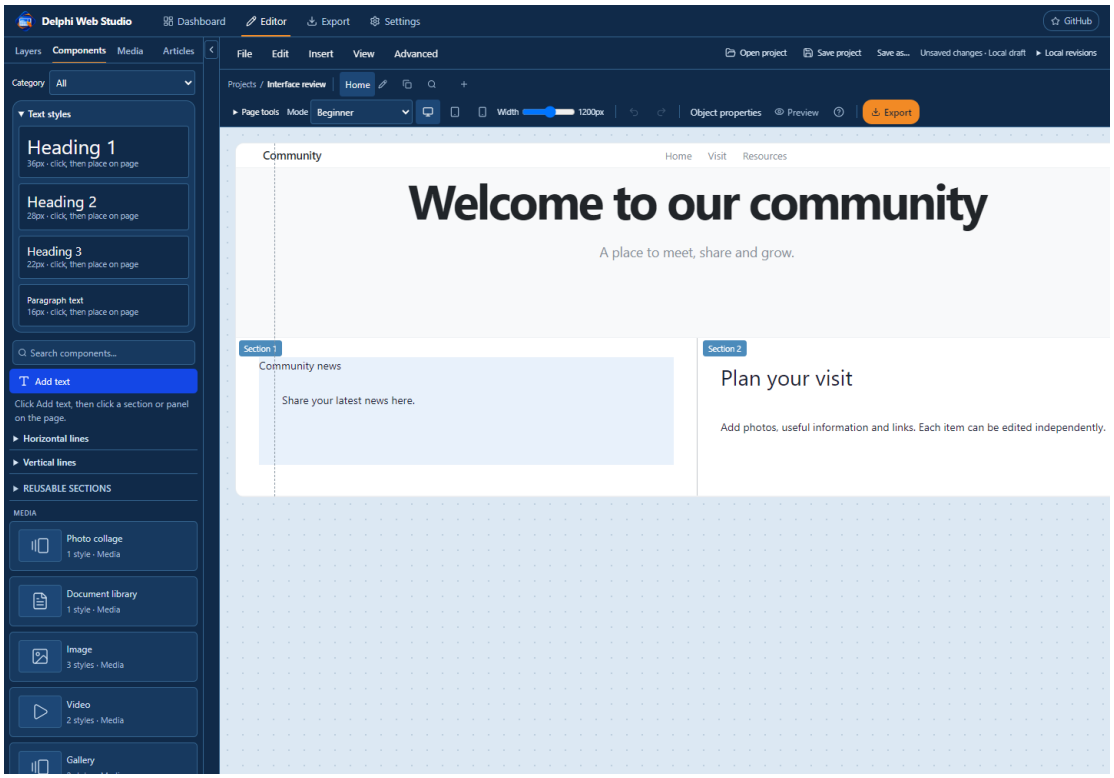

Illustrated explanations and examples for the Win32 and Win64 desktop editions.

The editor at a glance

The canvas occupies the working area, with project commands and page controls above it. Open the left panel when you need Elements, Layers, Media or Articles. Selecting an item on the canvas gives you its outline and tools; Properties then opens a separate window for that selection rather than a long list of everything on the page.

The editor keeps the page central and brings additional tools into view when they are needed.

Menu	Use it for
File	Open, Save, Save As, the Dashboard project list, and website export.
Edit	Undo or redo changes, use clipboard commands, and open Layers.
Insert	Place text, panels, and lines, or open the media library.
View	Open Elements, Layers, or Media, switch to Preview, and see shortcuts.
Advanced	Import HTML or WordPress content, inspect project JSON, or view undo history.

Use the dotted workspace and dashed guides while composing, then switch to Preview to see the visitor view. Menus collect less frequent commands without taking space from the page. Escape usually closes the active menu or cancels placement, although its effect depends on the control that currently has focus.

Project files and save status

Open project chooses an editable JSON or ZIP from disk. Dashboard cards instead reopen local drafts. When the same saved snapshot already has a matching draft, opening it reuses that draft and preserves newer local work. The desktop session remembers a file opened or saved through its file controls so ordinary Save can return to the same destination.

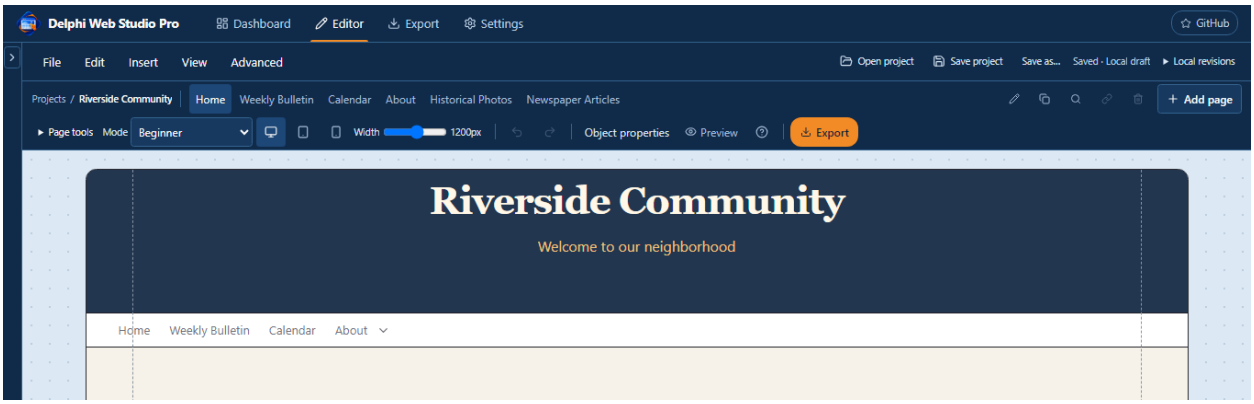

1. Use File > Open project or Ctrl+O to choose the file you want to continue. Check its project name and media before editing.
2. Use Save or Ctrl+S to update that destination. On the first save, choose a name and folder. Use Save as or Ctrl+Shift+S for an independent version.
3. Wait for Saved before closing. When saving has failed or been cancelled, leave the editor open and choose another destination if necessary.

Status	What it means
Unsaved changes	The current work differs from the last confirmed file. The local draft may have newer edits.
Working or Saving	The editor is preparing the project or Windows is completing the write.
Saved	The desktop app confirmed the file write. Hover over the status for the full path.
Save failed	The file was not confirmed. Check the native status message and retry or choose Save As.

File > Exit and the window X use the same closing guard. A clean project closes directly. With unsaved edits, Yes saves before closing after confirmation, No leaves without another file update and Cancel returns to the editor. If you edited while a save was being prepared, the newer work may still need to be saved.

Page selection and fixed commands

The page tabs stay in one group and the commands beside Add page stay in a fixed location. Each command applies to the active page. When there are too many tabs to see comfortably, select the page by name with Go to page instead of hunting through the strip.

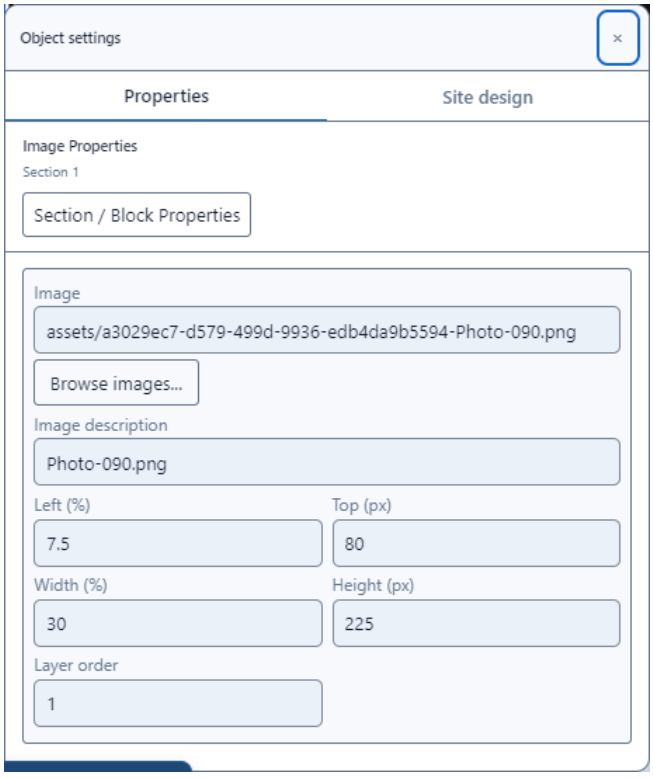

The selected page changes, while the fixed command group remains beside Add page.

Rename changes the editor label; Change address changes the route and can update supported references. Duplicate creates another page with a new identity and address. Search details edits that page's metadata. Delete asks for confirmation and shows known incoming references. The current Home address / is protected.

Page tools also provides Add page, Plan pages and Check site. Creating a page and adding its visitor navigation are separate tasks, so remember to update the Navbar or other links when the new destination should be discoverable.

Selection handles and floating windows

Click once to select an object and double-click its editable text to type. A selected outline supplies movement and resize affordances, while right-click offers actions for the item under the pointer. If a panel and its text overlap, use Layers, Alt-click or the available layer-selection command to reach the item you intend.

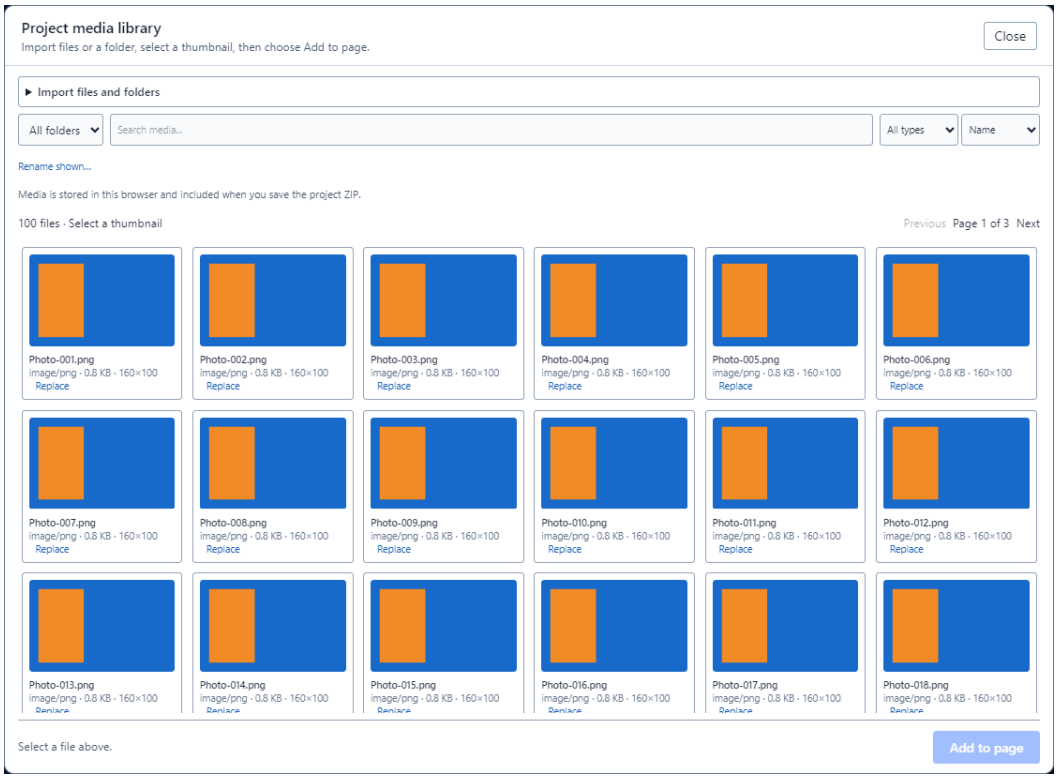

Focused image properties pair position and size fields and keep the file choice with the selected image.

Shift-click can build a group of section objects. Alignment works within a compatible section, and distribution needs at least three objects. Front and back commands change the local stack. Duplicating a panel carries its attached items and formatting, which is useful for making a second card with the same structure.

Drag a floating window by its title bar when another part of the page needs to be visible. Scroll inside it to reach the rest of its fields, and close it when you want the full canvas again. Section or Block Properties changes the selection scope to the surrounding container; Link and Anchor open their own focused settings.

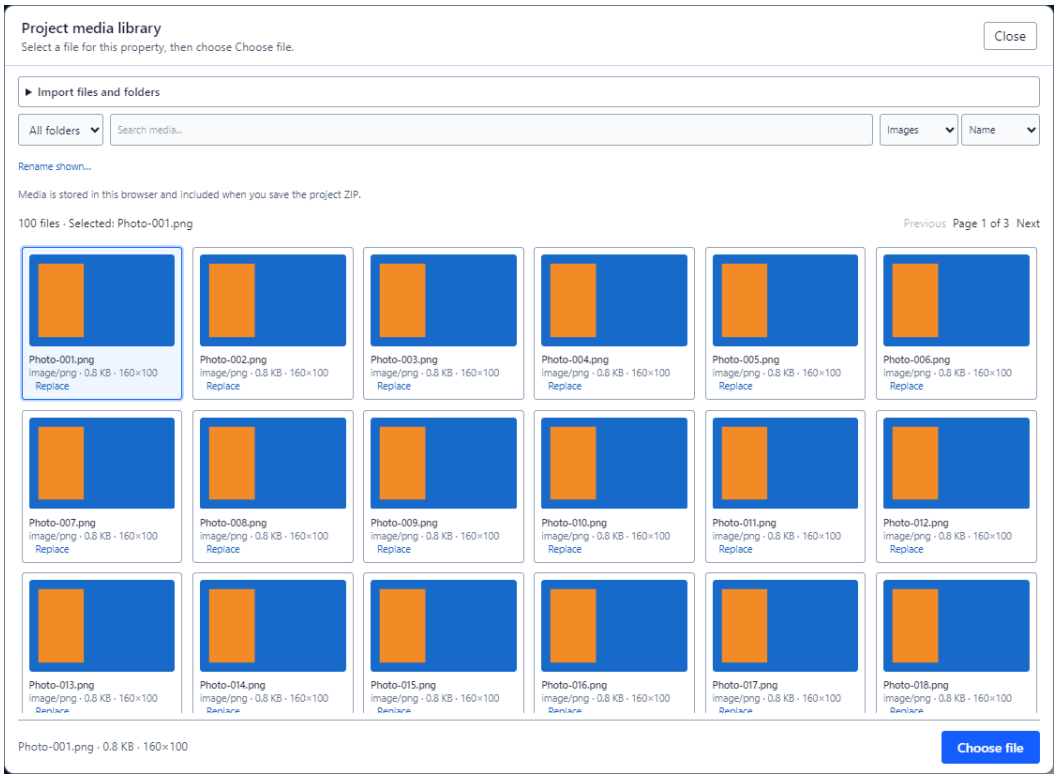

The media picker and the media manager

Use the picker when the goal is to place or choose a file. It offers thumbnails, folders, search, type and sort filters, with up to 36 results on a page. Filters apply to the collection rather than just the visible thumbnails, making it practical to find a file in a large library.

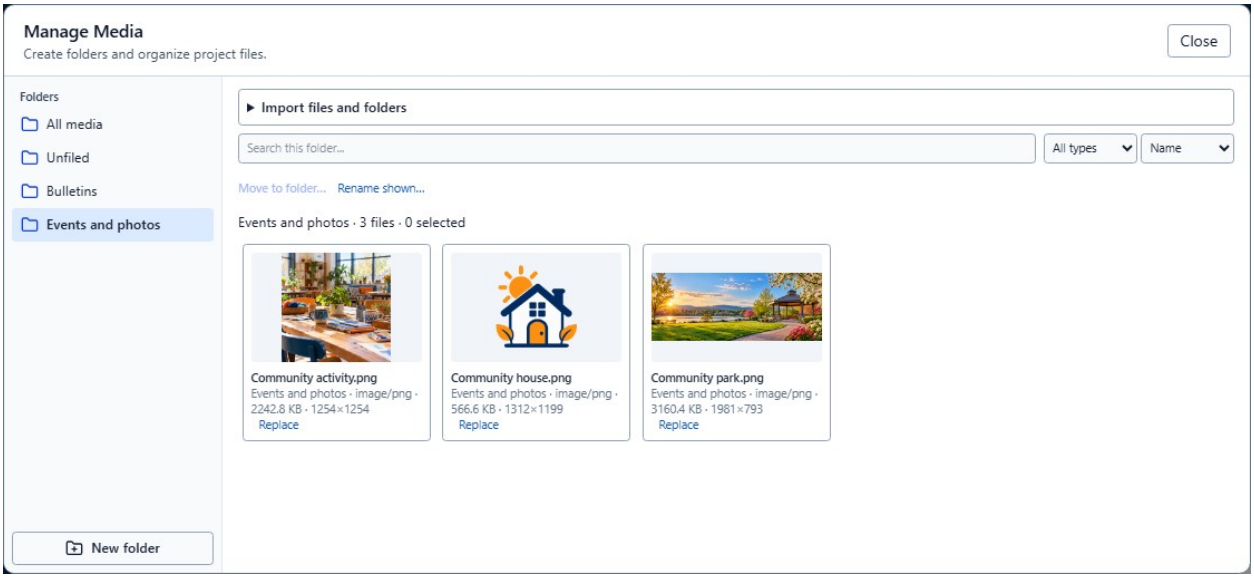

Thumbnails and filters help locate a file without scrolling through the full collection.

Add to page creates the appropriate object or block; an image placement then asks you to click a section or panel. Choose file returns the selected asset to the property that opened the picker. If you are changing an existing gallery entry, use that property path so you do not accidentally add another page object.

A property picker returns the chosen file to the existing item.

Manage Media is the organizational view. New folder creates a logical project folder, while dragging files onto a folder or using Move to folder changes their membership. All media shows the whole collection and Unfiled shows entries outside named folders. These moves retain asset identity and keep existing page references working.

Folder management and page placement are separate views of the same project media.

Imported bytes are copied into the project's local media store. Save the project ZIP to carry those files and their folder organization to another computer. Renaming or reorganizing the source directory in Windows is different from organizing the imported project library.

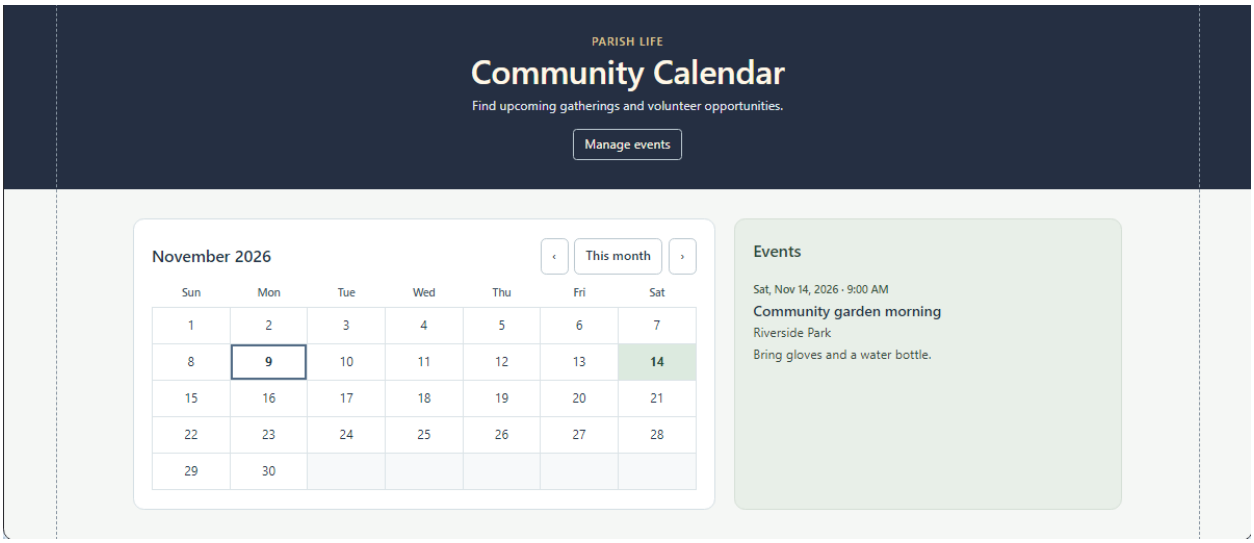

Settings shortcuts and visitor controls

Project settings describe this website, including its name, webmaster contact email and search details. Application settings hold the optional connection for the Windows account. Object Properties changes a selected item, while Site design establishes common colors and typography. Choose the scope first so a small correction does not unintentionally become a site-wide change.

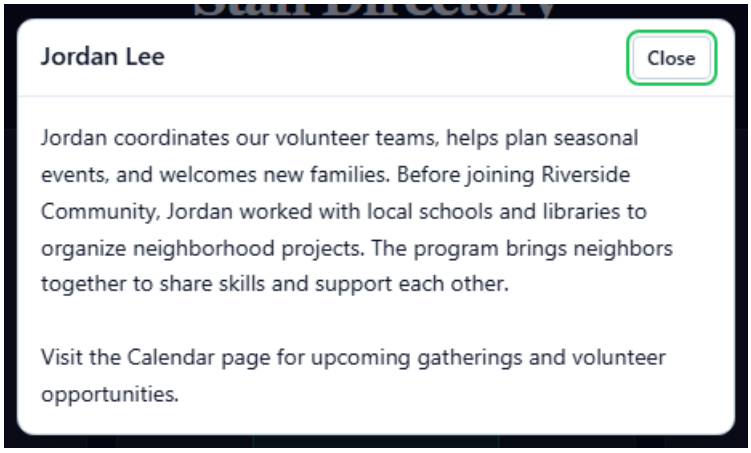

Scope	Where to find it
Application	Settings > Application settings: optional Google AI and the key saved for this Windows account.
Project	Settings > Project settings and its related tabs: site identity, webmaster email, search details, domain, and analytics.
Object or section	Right-click the selected item or choose Properties on its toolbar. Changes apply to that item or its container.
Site design	Open Site design in the properties window to change website theme and typography.

Shortcut	Action
Ctrl+O	Open project
Ctrl+S	Save to the current file
Ctrl+Shift+S	Save As
Ctrl+Z / Ctrl+Y	Undo / redo editor changes
Shift+Click / Alt+Click	Add to selection / cycle overlapping items
Arrow keys	Nudge a selected object
Esc	Close an active dialog or cancel placement
P / ?	Preview / shortcut help when focus is on the editor

Preview is the place to use visitor controls. A Navbar parent remains clickable while its arrow opens the submenu, and Escape returns focus to that arrow. Calendar month controls browse the stored events; Manage events appears only for authoring. A long staff biography opens in a separate scrollable reader rather than expanding the entire row.

Manage events edits the Calendar. Month navigation lets a visitor browse it.

The full biography reader keeps the staff cards compact while making longer text available.

The Windows app can save a Gemini key through Credential Manager for the current account. Cloud generation still needs session consent before a request is made. A saved connection is separate from page content and should never be pasted into a text box or included in a screenshot.

Understanding what a save has confirmed

Before saving, the editor flushes active text edits and captures the configuration, settings and media needed for a portable project. The desktop host then stages the bytes, checks the destination and commits the selected file. Only after that completion does the editor compare the saved snapshot with its current state and decide whether it is clean.

This explains why a file download request and a confirmed Save are different events. If writing fails, the editor must remain available with its changes. If a later keystroke arrives while the earlier snapshot is being written, it remains unsaved even though the file update succeeded. Read the status in the context of what you did after starting the save.
