Delphi Web Studio Pro Test Guide

Build and verify a sample website

Last changed November 9, 2026

Use Riverside Community or another disposable project to check your Windows build, media handling and website export. Keep the included sample files available. Run the checks independently in Win32 and Win64 if you use both builds.

The editor ready for a practice project on the Home tab.

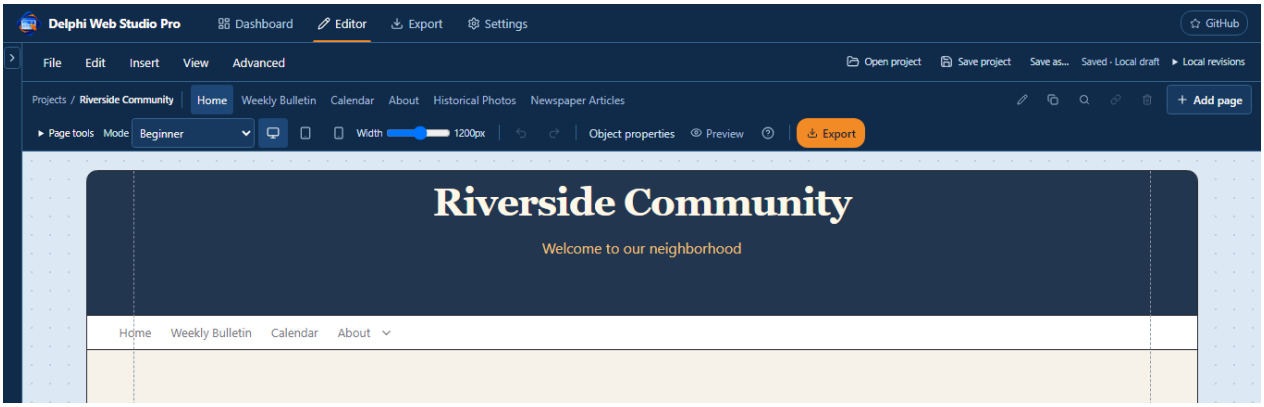

Contents

Open the editor and start a practice site....3
Import and move sample media....4
Check visitor navigation and PDF controls....5
Save reopen and review an export....6
Record results and diagnose common failures....6

Open the editor and start a practice site

Open bin\Win64 or bin\Win32 and run DelphiWebStudioPro.exe with its editor directory and WebView2Loader.dll beside it. Windows needs the Microsoft Edge WebView2 Runtime. Select Community on the Dashboard and confirm Home opens with editable starter content.

Edit the Home headline. Choose Add page and create News at /news. Select News and then Home. Confirm the tabs stay together and the icons beside Add page target the selected page. Try Undo and Redo on a disposable change.

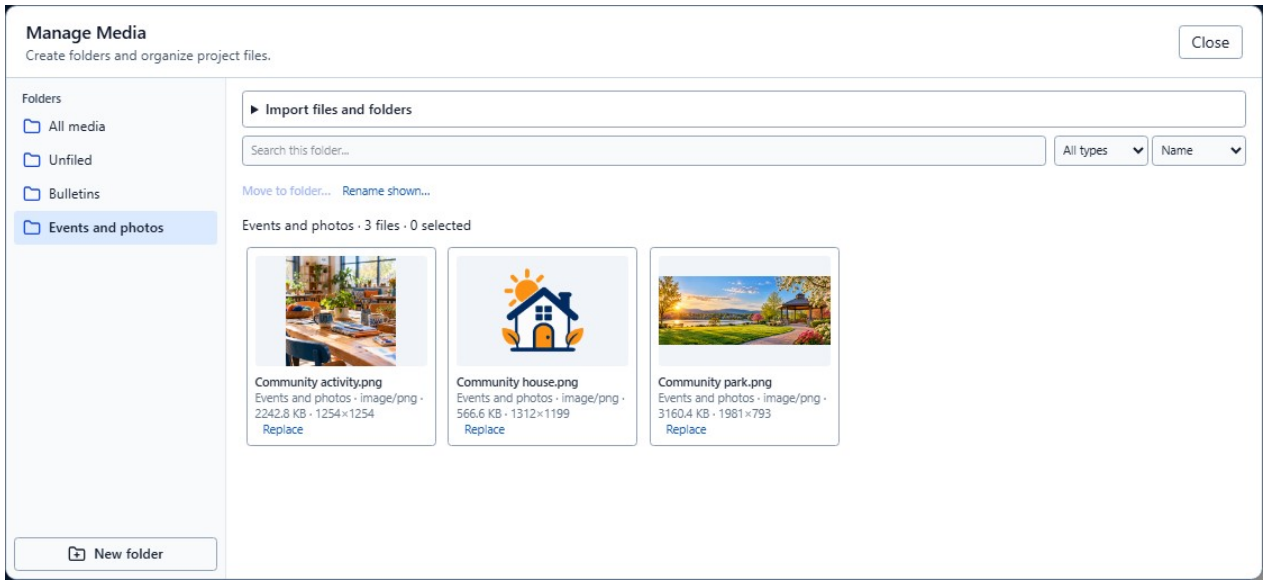

The page tabs stay together. The five commands beside Add page apply to the selected tab.

Import and move sample media

Open View > Manage Media. Create Events and photos and Bulletins. Import a sample PNG from images and icons and Community_Bulletin_Sample.pdf from samples. Move the image to Events and photos and the PDF to Bulletins. Select each folder and confirm its file is present.

Open View > Media library. Choose Events and photos, select the image, and choose Add to page. Place it in the canvas and add an image description. Move the imported file to a different folder through Manage Media and confirm the page still shows it.

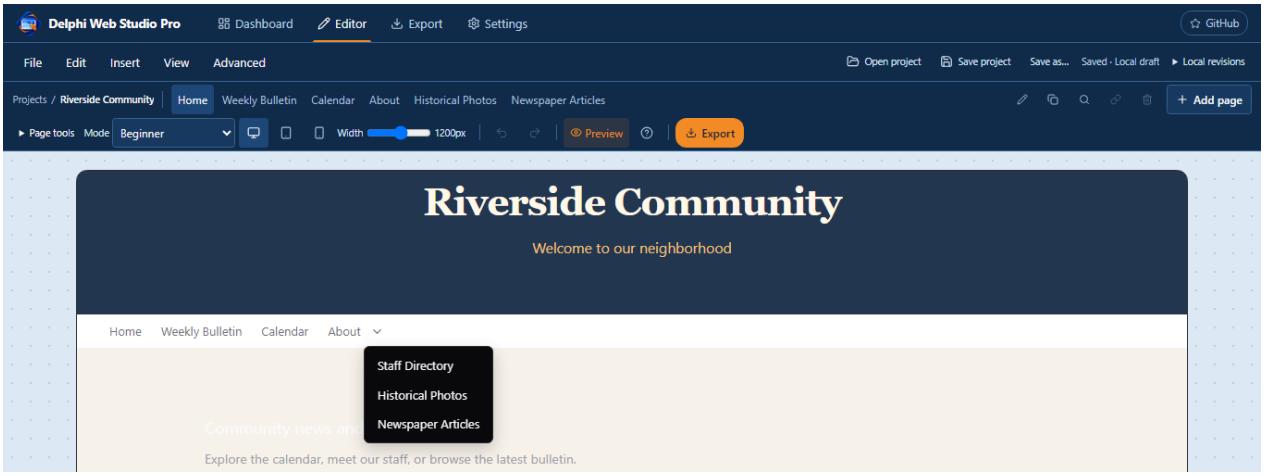

Manage Media organizes files in this project. Select a folder in the sidebar to see its contents.

Check visitor navigation and PDF controls

Create an About page at /about. Add a Navbar with Home and About. Add News under About as a submenu item with /news as its destination. Toggle Preview. Check About remains a separate page link, its arrow opens News, and Escape returns focus to the arrow.

Add a PDF Viewer or Weekly Bulletin document library on News. Choose the imported sample PDF. Check page navigation, zoom and scrolling. Repeat in Desktop, Tablet and Mobile preview widths.

About stays clickable. Its separate arrow opens the submenu in Preview.

Save reopen and review an export

Save the practice project as a .webstudio.zip. Edit a line and save over the current file. Reopen it and verify the text, image, PDF and folders. Reopen the same saved version again to check that a duplicate draft is not created. Save as a separate filename when you need an independent file.

Export a website ZIP and review its files locally. Check index.html, the generated News page, relative navigation and media. Use Open reviewed site in browser after website review to test the PDF over local HTTP. A file address can restrict the bundled PDF viewer. End the local preview when finished.

Record results and diagnose common failures

Record the platform, project file, page, control, expected result and actual result. Include a screenshot for a reproducible display issue. If the editor fails to start, verify the WebView2 Runtime and the adjacent editor folder.

If media is missing, open the editable project ZIP and inspect its library. Verify that the saved project file is separate from the website export. For an interrupted save, preserve the original and use the recovery command only if the editor identifies a staged file.
